

LISTING OF THE CLAIMS

The following listing, if entered, replaces all prior versions of the claims in the present application.

1. **(Currently Amended)** A method comprising:
receiving invoice adjustment information in an application-specific data object format from each of a plurality of **processing systems, wherein each processing system comprises an application[[s]], and wherein the invoice adjustment information is received at a transport layer;**
receiving configuration information relating to the processing systems at the transport layer, wherein the configuration information is received via an adapter; and
translating the invoice adjustment information into a common invoice adjustment data object format, **wherein the translating comprises:**
accessing a first storing unit configured to store transformation information;
accessing a second storing unit configured to store defined business processes; and
using a business process controller configured to execute the business processes, wherein the execution is in response to predefined events.
2. **(Currently Amended)** The method of claim 1 further comprising:
inter-exchanging invoice adjustment information in the common invoice adjustment data object format between two or more of the plurality of **applications processing systems.**

3. **(Currently Amended)** The method of claim 2 further comprising:
translating invoice adjustment information in the common invoice adjustment
data object **format** to an application-specific data object format for use by
a respective application.
4. **(Original)** The method of claim 3 wherein the common invoice adjustment data
object format uses an extensible markup language format.
5. **(Original)** The method of claim 4 further comprising the precedent operations of:
determining essential data elements of a common invoice adjustment data object
format; and
creating a common invoice adjustment data object format including at least the
essential data elements.
6. **(Original)** The method of claim 5 wherein the essential data elements are
determined based upon elements of a plurality of application-specific data object formats.
7. **(Original)** The method of claim 6 wherein the essential data elements include an
identification data element, invoice adjustment base data element, a billing data element,
a status data element, and a list of invoice adjustment line item details data element.
8. **(Original)** The method of claim 7 wherein the common invoice adjustment data
object format includes at least one complex data element.
9. **(Original)** The method of claim 8 wherein the common invoice adjustment data
object format includes one or more related data elements selected from the group
consisting of a related party data element, a related employee data element, a related
invoice data element, and a related comments data element.

10. **(Currently Amended)** A machine-readable medium having stored thereon a data structure, wherein the data structure using uses an extensible markup language format, is configured to be used in translating invoice adjustment information into a common invoice adjustment data object format, and ~~the data structure comprising~~ comprises:
- an identification data element;
 - invoice adjustment base data element;
 - a billing data element;
 - a status data element; and
 - a list of invoice adjustment line item details data element.
11. **(Original)** The machine-readable medium of claim 10 wherein the data structure further comprises:
- at least one complex data element.
12. **(Original)** The machine-readable medium of claim 11 wherein the data structure further comprises:
- one or more related data elements selected from the group consisting of a related party data element, a related employee data element, a related invoice data element, and a related comments data element.
13. **(Currently Amended)** A machine-readable medium that provides executable instructions, which, when executed by a computing system, cause the computing system to perform a method comprising:
- receiving invoice adjustment information in an application-specific data object format from each of a plurality of processing systems, wherein each processing system comprises an application[[s]], and wherein the invoice adjustment information is received at a transport layer;

receiving configuration information relating to the processing systems at the transport layer, wherein the configuration information is configured to be received via an adapter; and

translating the invoice adjustment information into a common invoice adjustment data object format, **wherein the translating comprises:**

accessing a first storing unit configured to store transformation information;

accessing a second storing unit configured to store defined business processes; and

using a business process controller configured to execute the business processes, wherein the execution is in response to predefined events.

14. (Currently Amended) The machine-readable medium of claim 13 wherein the method further comprises:

inter-exchanging invoice adjustment information in the common invoice adjustment data object format between two or more of the plurality of **applications processing systems.**

15. (Original) The machine-readable medium of claim 14 wherein the method further comprises:

translating invoice adjustment information in the common invoice adjustment data object to an application-specific data object format for use by a respective application.

16. (Original) The machine-readable medium of claim 15 wherein the common invoice adjustment data object format uses an extensible markup language format.

17. (Original) The machine-readable medium of claim 16 wherein the method further comprises the precedent operations of:

determining essential data elements of a common invoice adjustment data object format; and

creating a common invoice adjustment data object format including at least the essential data elements.

18. (Original) The machine-readable medium of claim 17 wherein the essential data elements are determined based upon elements of a plurality of application-specific data object formats.

19. (Original) The machine-readable medium of claim 18 wherein the essential data elements include an identification data element, invoice adjustment base data element, a billing data element, a status data element, and a list of invoice adjustment line item details data element.

20. (Original) The machine-readable medium of claim 19 wherein the common invoice adjustment data object format includes at least one complex data element.

21. (Original) The machine-readable medium of claim 20 wherein the common invoice adjustment data object format includes one or more related data elements selected from the group consisting of a related party data element, a related employee data element, a related invoice data element, and a related comments data element.

22. (Currently Amended) A system comprising:
a plurality of processing systems, wherein each processing system
storing comprises at least one application that processes invoice
adjustment information, the invoice adjustment information having
an application-specific data object format, and

is coupled to an adapter, wherein the adapter is configured to receive configuration information from the processing system; and
 an integration server[[,]] coupled ~~via a network~~, to each of the plurality of processing systems, wherein the integration server ~~translating~~ translates invoice adjustment information from an application specific data object format to a common invoice adjustment data object format, and
the integration server comprises:
a transport layer configured to receive invoice adjustment information;
a first storing unit configured to store transformation information;
a second storing unit configured to store defined business processes
a business process controller configured to execute the business processes,
wherein the execution is in response to predefined events.

23. (Original) The system of claim 22 wherein invoice adjustment information in the common invoice adjustment data object format is inter-exchanged between two or more processing systems.

24. (Original) The system of claim 23 wherein the common invoice adjustment data object format uses an extensible markup language format.

25. (Original) The system of claim 24 wherein the common invoice adjustment data object format includes a set of essential data elements, the set of essential data elements are determined based upon elements of a plurality of application-specific data object formats.

26. (Original) The system of claim 25 wherein the set of essential data elements includes an identification data element, invoice adjustment base data element, a billing data element, a status data element, and a list of invoice adjustment line item details data element.

27. (Original) The system of claim 26 wherein the common invoice adjustment data object format includes at least one complex data element.

28. (Original) The system of claim 27 wherein the common invoice adjustment data object format includes one or more related data elements selected from the group consisting of a related party data element, a related employee data element, a related invoice data element, and a related comments data element.
